## 10 Field of the Invention

The present invention relates to cyclopropylindole derivatives and pharmaceutical compositions comprising said derivatives useful for the treatment of various psychiatric disorders and premature ejaculation.

15 Background of the Invention

Selective serotonin reuptake inhibitors (SSRIs) are effective for the treatment of mental depression and have been reported to be useful for treating chronic pain. See R.W. Fuller, Pharmacologic Modification of Serotonergic Function: Drugs for the Study and Treatment of Psychiatric and Other Disorders," J. Clin. Psychiatry, 47:4 (Suppl.) April 1986, pp. 4-8 and Selective Serotonin Reuptake Inhibitors. Edited by JP Feighner and WF Boyer, Chichester, England. John Wiley & Sons, 1991, pp 89-108. SSRI's have also demonstrated efficacy for the treatment of anxiety disorders. More recently, SSRI's have demonstrated efficacy in the treatment of premature ejaculation. See Kim and Paick, Short-term Analysis of the Effects of As Needed Use of Sertraline at 5 pm for the Treatment of Premature Ejaculation, *Urology* 54:544-547 (1999); Kim and Paick, Self Therapy with Sertraline given PRN at 5 pm in treatment of Premature Ejaculation, *Journal of Urology* 54:544-547 (1998); McMahon and Touma, Treatment of Premature Ejaculation with Paroxetine Hydrochloride As Needed: 2 Single-Blind Placebo Controlled Crossover Studies *Journal of Urology* 161:1826-1830 (1999); Haensal *et al.*, Clomipramine and sexual function in men with premature ejaculation and controls *Journal of Urology* 158:1310-1315 (1998); and McMahon and Touma, Treatment of Premature Ejaculation with Paroxetine Hydrochloride *International Journal Impotence*

Research 11:241-246 (1999). Thus novel SSRI's effective for the treatment of these and other disorders would be greatly advantageous.

The description of the invention herein should be construed in congruity with the laws and principals of chemical bonding. For example, it may be necessary to remove a hydrogen atom in order accommodate a substituent at any given location.

An embodiment or aspect which depends from another embodiment or aspect, will describe only the variables having values or provisos that differ from the embodiment or aspect from which it depends.

If a variable is quantified with a value of zero, then any bond attaching said  
5 variable should no longer be represented, *e.g.*, if  $n$  in  $(R^3)_n$  equals 0, then the bond attaching  $R^3$  to G should no longer be represented.

As used herein, "halo" or "halogen" includes fluoro, chloro, bromo and iodo.

As used herein, "C<sub>1-4</sub>alkylene" means a one to four carbon alkane having one  
10 hydrogen atom removed from two different carbon atoms in said alkane, *e.g.*,  
-CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>- .

As used herein, "C<sub>1-4</sub>alkylidene" means a one to four carbon alkane having  
two hydrogen atoms removed from one carbon atom in said alkane, *e.g.* ,

It should be understood that the alternating double bond designations in the  
15 six-membered ring of the 5,6-membered fused structure represented in Formula (I)  
are relative and represent the delocalized  $\pi$  orbital electrons of said ring.

It is to be understood that the present invention may include any and all  
possible stereoisomers, geometric isomers, diastereoisomers, enantiomers, anomers  
and optical isomers, unless a particular description specifies otherwise.

In accordance with good clinical practice, it is preferred to administer the instant compounds at a concentration level which will produce effective beneficial effects  
20 without causing any harmful or untoward side effects.

### Synthesis

Compounds of the present invention may be synthesized according to the general schema provided below. Variables provided in the schema below are defined  
25 in accordance with the description of compounds of the above Formulae unless otherwise specified.

A preferred method for the preparation of trans-cyclopropanes of Formula I is illustrated in Scheme 1. A appropriately substituted heterocyclic aldehyde, where Pg  
30 is a protecting group such as p-toluenesulfonyl when G is nitrogen, is reacted with a appropriated olefinating reagent, such as a Horner-Emmons reagent. The resulting heterocyclic trans-acrylic acid derivative, preferably the N-methoxy-N-methyl amide, is cyclopropanated using reagents such as diazomethane and palladium(II)acetate, or

trimethylsulfoxonium iodide with an appropriate base. The resulting cyclopropyl amide derivative is reduced to the aldehyde using reagents such as LAH, or the like. Subsequent reductive amination using an appropriately substituted amine with an reducing agent such as sodium triacetoxyborohydride, sodium cyanoborohydride, or the like, gives the cyclopropyl methyl amine. Removal of protecting groups, such as the p-toluenesulfonyl group, when G is nitrogen, using mild basic hydrolysis, gives the trans-cyclopropyl compounds of Formula 1.

Scheme 1

A preferred method of preparing cis-cyclopropyl compounds of Formula I is described in Scheme 2. This method is similar to that in Scheme 1, except for the use of olefinating reagents, such as the trifluoroethyl Horner-Emmons reagent, that selectively give the heterocyclic cis-acrylic acid derivatives, where Pg is a protecting group such as p-toluenesulfonyl when G is nitrogen. Further reaction of the cis-acrylic acid derivatives, in a manner similar to that described in Scheme 1, provides the cis-cyclopropyl compounds of Formula I.

Scheme 2

- A preferred method for the preparation of compounds of Formula I where  $\text{A}^3$  is a branched alkylidene chain is illustrated in Scheme 3. The N-methoxy-N-methylcyclopropyl carboxamide intermediate, where Pg is a protecting group such as p-toluenesulfonyl when G is nitrogen, is reacted with a nucleophile, such as an alkyl magnesium halide or alkyl lithium. The resulting cyclopropyl alkyl ketone is reductively aminated and subsequently deprotected in a manner similar to that described in Scheme 1 to give compounds of Formula I where  $\text{A}^3$  is a branched alkylidene chain.

Scheme 3

15

Another preferred method for the preparation of compounds of Formula I is illustrated in Scheme 4. An appropriately substituted vinyl heterocycle, where Pg is a

protecting group such as p-toluenesulfonyl when G is nitrogen, is reacted with an appropriate diazoacetate ester, such as ethyl or tert-butyl diazoacetate, in the presence of a catalyst such as the Nishiyama catalyst. [(*R*)-*trans*-Cl<sub>2</sub>Ru(pybox-ip)(CH<sub>2</sub>=CH<sub>2</sub>) was prepared from 2,6-bis(4*R*)-(+)-isopropyl-2-oxazolin-2-yl]pyridine (Aldrich Chemical Co.) according to: Nishiyama, H.; Itoh, Y.; Matsumoto, H.; Park, S.-B.; Itoh, K. *J. Am. Chem. Soc.* **1994**, *116*, 2223.] The resulting cyclopropyl ester is reduced to the alcohol using reagents such as DIBAL, LAH, or the like. The resulting alcohol is then oxidized to the corresponding aldehyde using standard methods, such as PCC or DMSO/oxalyl chloride. The resulting aldehyde is then converted to the compounds of Formula 1 by the methods outlined in Scheme 1.

Scheme 4

The vinyl heterocycle intermediates, where Pg is a protecting group such as p-toluenesulfonyl when G is nitrogen, can be prepared in several ways (Scheme 5). Treatment of an appropriate aldehyde with an organometallic reagent such as methyl magnesium bromide, or the like, with subsequent dehydration of the resulting alcohol using reagents such as p-toluene sulfonic acid, or the like, is one preferred method for the preparation of the vinyl heterocycle intermediates. Another preferred method consists of acetylation of the heterocycle using reagents such as acetyl chloride and diethylaluminum chloride, or the like, followed by the optional protection of the heterocycle using p-toluenesulfonyl chloride and triethyl amine, or the like.

Reduction of the acetyl group using sodium borohydride, or the like, with subsequent dehydration of the resulting alcohol gives the vinyl heterocycle.

Scheme 5

The preparation of indazole compounds of Formula 1 is described in Scheme 6. The aryl cyclopropyl ketone intermediate is prepared by methods known to those skilled in the art, such as a palladium mediated coupling of an aryl boronate with a cyclopropane thioester. This ketone intermediate is reacted with an appropriately substituted hydrazine, such as p-toluenesulfonylhydrazide, and subsequently cyclized to an indazole under mild basic conditions, such as potassium carbonate. The resulting cyclopropyl ester is converted to compounds of Formula 1 by methods similar to those described in Scheme 3.

Scheme 6.

The preparation of compounds of Formula 1, where G is sulfur, is described in Scheme 7. The appropriately substituted carboxaldehyde is carried through a reaction sequence in a manner similar to that described in Scheme 1 to give the compounds of

5 Formula I, where G is sulfur.

Scheme 7

10

The preparation of indole and indazole compounds of Formula 1, where R<sup>3</sup> is lower alkyl, is described in Scheme 8, along with the preparation quaternary alkyl ammonium salts of compounds of Formula 1. Indole and indazole compounds of

Formula 1, where  $R^3$  is H, are reacted with bases such as sodium hydride or potassium tert-butoxide in the presence of alkylating reagents, such as dimethyl sulfate or diethyl sulfate, to give derivatives where  $R^3$  is lower alkyl. Quaternary alkyl ammonium salts of compounds of Formula 1, are prepared by reaction of tertiary amine compounds of Formula 1 with alkyl halides, such as methyl iodide.

Scheme 8

- Another preferred method for preparing compounds of Formula 1, where  $A^4$  is attached at points X,  $X^1$ , or  $X^2$ , is described in Scheme 9. An appropriately substituted heterocycle, with a reacting group Rg (such as iodo, bromo, or trifluoromethanesulfonyl groups) is present at points X or  $X^2$  is reacted with an appropriately substituted acrylamide under catalysis with palladium(II)acetate, or the like. The resulting substituted acrylamide derivative is converted to compounds of Formula I by methods similar to those described in Scheme 1. The substituted acrylamide derivative can also be prepared from appropriately substituted heterocyclic aldehyde, where the aldehyde is attached at points X,  $X^1$ , or  $X^2$ . Olefination of the aldehyde with the Horner-Emmons reagent under conditions described in Scheme 1 also gives the substituted acrylamide derivative which can be converted to compounds of Formula I by methods similar to those described in Scheme 1.

Scheme 9

Other suitable means of synthesizing said compounds may also be available. More detailed descriptions of synthesizing compounds of the present invention are also provided. The required starting materials and reagents, such as substituted indoles and indolecarboxaldehydes, for these methods can be obtained from commercial sources. Other starting materials that are not commercially available can be prepared by standard methods known to those skilled in the art.

**Example 1*****Trans-2-[5-Cyanoindol-3-yl]-1-(N,N-dimethylaminomethyl)cyclopropane***

Phosphorus oxychloride (10.9 ml, 117 mmol) was added dropwise over 30 min to anhydrous dimethylformamide (50 ml) that was maintained at 10-20°C (internal temperature). The resulting mixture was stirred for 30 min and then chilled to 0° C. A solution of commercially available 5-cyanoindole (15 g, 106 mmol) in anhydrous dimethylformamide (30 ml) was added over 10 min. The ice bath was removed and the solution was allowed to warm to room temperature. After 2 h, a very thick paste resulted. The off-white paste was carefully quenched with ice chips. An aqueous solution of sodium hydroxide (2.12 g NaOH/100 ml H<sub>2</sub>O) was added. After a mild exotherm, a clear yellow solution resulted. The solution was poured into water (~400 ml) and a fine solid immediately precipitated. The mixture was filtered

through a 600 ml glass fritted funnel of medium porosity. The yellow filtrate was diluted with an equal volume of water and left to stand for 16 h. A yellow precipitate was collected by vacuum filtration. The solid was dried overnight under vacuum to afford 13.6 g (75% yield) of (5-cyanoindol-3-yl)carboxaldehyde:  $^1\text{H}$  NMR (500 MHz, DMSO- $\text{d}_6$ ) 12.58 (1 H, br s.), 10.00 (1 H, s), 8.51 (1 H, d,  $J = 3.1$  Hz), 8.46 (1 H, d,  $J = 0.6$  Hz), 7.22 (1 H, dd,  $J = 8.6, 0.5$  Hz), 7.64 (1 H, dd,  $J = 8.5, 1.6$  Hz); MS  $m/e$  171 ( $M + H$ ) $^+$ .

The following procedure was carried out behind a safety shield using plastic coated glassware free of scratches and ground glass joints. 1-Methyl-3-nitro-1-nitrosoguanidine (14.4 g, 98 mmol) was carefully added portionwise over 30 min to a Erlenmeyer flask containing a swirled mixture of aqueous sodium hydroxide (100 ml, 5 N) and diethyl ether (250 ml) at 0°C. After vigorous bubbling had ceased, the organic layer (containing diazomethane) was decanted into a chilled (0°C) Erlenmeyer flask containing potassium hydroxide chips (20 g). The mixture was swirled for 10 min and the yellow solution was decanted into a dropping funnel. The solution of diazomethane was added over 30 min to an open flask containing a stirred mixture of (*E*)-[5-Cyano-1-(*p*-toluenesulfonyl)indol-3-yl]-*N*-methoxy-*N*-methylacrylamide (8.0 g, 19.6 mmol) and palladium acetate (132 mg, 0.58 mmol) in dichloromethane (200 ml) maintained at 0 °C. After stirring for 1 h, a second batch of freshly prepared diazomethane (98 mmol) in ~250 ml of diethyl ether was added over 30 min. After stirring for 1 h, the reaction was quenched with glacial acetic acid (4 ml) and poured into an aqueous saturated solution of sodium bicarbonate (250 ml). The aqueous layer was extracted with ethyl acetate (3 x 100 ml). The organic layers were washed with brine, dried over anhydrous magnesium sulfate, and concentrated in vacuo. The crude product was triturated with ethyl acetate (150 ml) and cooled with vigorous stirring to 0 °C for 1 h. The reaction was stirred 24 hr at room temperature and the solvent was removed *in vacuo*. The residue was taken up in water (100 ml) and was extracted with ethyl acetate (3x 50 ml). The organic phase was dried with magnesium sulfate and allowed to stand for 16 hr. The resulting crystals were collected by filtration. The filtrate was evaporated and the residue was recrystallized from ethyl acetate and hexanes to give a second crop of crystals. A total of 4.71 g (58%) (+)-N-[(E)-3-[5-cyano-1-(*p*-toluenesulfonyl)indol-3-yl]-2-propenoyl]-bornane-10,2-sultam was collected as a white solid: mp 203-205° C; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>): δ 8.15 (1 H, s), 8.09 (1 H, d, J = 8.8 Hz), 7.98 (1 H, s), 7.81 (1 H, d, J = 15.7 Hz), 7.80 (2 H, d, J = 8.4 Hz), 7.62 (1 H, dd, J = 8.6, 1.4 Hz), 7.29 (2 H, d, J = 8.1 Hz), 7.25 (1 H, d, J = 15.6 Hz), 3.99 (1 H, dd, J = 7.4, 5.2 Hz), 3.53 (2 H, AB, Δν = 32 Hz, J = 13.8 Hz), 2.38 (3 H, s), 2.25-2.12 (2 H, m), 2.01-1.87 (3 H, m), 1.48-1.32 (2 H, m), 11.21 (3 H, s), 1.00 (3 H, s); MS m/e 564.3 (M + H)<sup>+</sup>.

The following reaction was performed behind a blast shield using glassware without ground glass joints. A solution of diazomethane in ether was prepared by slowly adding 1-methyl-3-nitro-1-nitrosoguanidine (13.3 g, 90 mmol) to a mixture of diethyl ether (200 ml) and 5N NaOH (200 ml) at 0 °C and then decanting the ether layer. The ether layer was dried with potassium hydroxide and transferred to a dropping funnel. This ethereal diazomethane solution was then added dropwise over 30 min to a solution of (+)-N-[(E)-3-[5-cyano-1-(*p*-toluenesulfonyl)indol-3-yl]-2-propenoyl]bornane-10,2-sultam (5.1 g, 9.0 mmol) and palladium(II)acetate (100 mg, 0.45 mmol) in dichloromethane (200 ml) at a temperature of -10 °C. The reaction was stirred a further 20 min with the temperature maintained below -5 °C, and was then quenched by the addition of acetic acid (6 ml). To the reaction 1 N NaOH (10 ml) was added and the layers were separated. The aqueous layer was extracted with ethyl acetate (2x 30 ml) and the combined organic layers were dried with magnesium sulfate and evaporated to dryness. The crude product was purified by chromatography on silica (20% ethyl acetate /in hexanes) to afford the 3.23 g (62%) of the product as a white solid. This material was recrystallized from 350 ml of boiling EtOH to provide 1.18 g of crystals. The mother liquor was evaporated and

recrystallized from 100 ml of boiling EtOH to provide a second crop of 1.22g. The total amount of recrystallized N-[(1*S*,2*S*)-*trans*-2-[5-cyano-1-(*p*-toluenesulfonyl)indol-3-yl]cycloprop-1-yl]carbonylbornane-10,2-sultam was 2.40 g (46%) as a white solid: mp 188-190° C; <sup>1</sup>H-NMR (400 MHz, CDCl<sub>3</sub>) 8.03 (1 H, d, J = 8.6 Hz), 7.99 (1 H, d, J = 1.0 Hz), 7.75 (2 H, d, J = 8.4 Hz), 7.57 (1 H, d, J = 1.2 Hz), 7.54 (1 H, dd, J = 8.6, 1.5 Hz), 7.25 (2 H, m), 3.96 (1 H, dd, J = 7.4, 5.1 Hz), 3.53 (2 H, AB, Δν = 18 Hz, J = 13.8 Hz), 2.57 (1 H, dt, J = 7.7, 4.8 Hz), 2.45 (1 H, m), 2.36 (3 H, s), 2.16-2.04 (2 H, m), 2.00-1.87 (3 H, m), 1.81 (1 H, dt, J = 9.1, 4.3 Hz), 1.55 (3 H, s), 1.50-1.32 (2 H, m), 1.29 (1 H, m), 1.21 (3 H, s), 1.00 (3 H, s); MS m/e 578.2 (M + H)<sup>+</sup>.

A solution of N-[(1*S*,2*S*)-*trans*-2-[5-cyano-1-(*p*-toluenesulfonyl)indol-3-yl]cycloprop-1-yl]carbonylbornane-10,2-sultam (2.30 g, 3.98 mmol) in THF (100 ml) was cooled to -40 °C (dry ice / acetonitrile). Lithium aluminum hydride (600 mg, 15.9 mmol) was added, with a further addition (600 mg) after 1 hr (reaction temperature maintained at -40 °C throughout). After a total reaction time of 1.5 hr ethyl acetate (50 ml) was added and the reaction was allowed to warm to room temperature. Water (1.2 ml) was added, and after 10 min 1N NaOH (3.6 ml) was added. After another 5 min, more water (1.2 ml) was added, and the reaction was stirred a final 15 min. Some magnesium sulfate was added and the mixture was filtered through celite and sand and rinsed with ethyl acetate. The filtrate was evaporated to dryness. The crude material was partially purified on a short pad of silica by elution with 50% ethyl acetate in hexanes. The (1*S*,2*S*)-*trans*-2-[5-cyano-1-(*p*-toluenesulfonyl)indol-3-yl]-cyclo-propanemethanol appeared as a white solid (1.18 mg, 81%): mp 140-141° C; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) 8.03 (1 H, dd, J = 8.6, 0.6 Hz), 8.00 (1 H, d, J = 1.5 Hz), 7.74 (2 H, d, J = 8.6 Hz), 7.55 (1 H, dd, J = 8.6, 1.5 Hz), 7.33 (1 H, d, J = 1.0 Hz), 7.26 (2 H, d, J = 8.5 Hz), 3.77 (1 H, m), 3.60 (1 H, m), 2.37 (3 H, s), 1.77 (1 H, m, ), 1.37 (1 H, m), 0.95 (2 H, t, J = 7.0 Hz); MS m/e 349.1 (M -OH+ H)<sup>+</sup>.

Oxalyl chloride (0.42 ml, 4.8 mmol) in dichloromethane (50 ml) at -78 °C was treated with DMSO (0.39 ml, 5.4 mmol) dropwise. After addition the reaction was stirred for 15 min and a solution of (1*S*,2*S*)-*trans*-2-[5-cyano-1-(*p*-toluenesulfonyl)indol-3-yl]-cyclopropanemethanol (1.17 g, 3.2 mmol) in

dichloromethane (10 ml) was added dropwise. After a further 15 min, triethylamine (2.45 ml, 17.6 mmol) was added dropwise. The reaction was stirred a further 5 min at  $-78\text{ }^{\circ}\text{C}$  and was then allowed to warm to room temperature. The reaction was washed with water (2x 10 ml), dried with magnesium sulfate and evaporated to dryness to give a yellow oil.

The crude (1*S*,2*S*)-*trans*-2-[5-cyano-1-(*p*-toluenesulfonyl)indol-3-yl]-cyclopropanecarboxaldehyde from the above procedure was dissolved in hot ethanol (50 ml) and treated with dimethylamine (3.2 ml of a 2M solution in THF, 6.4 mmol). After stirring 5 min, sodium triacetoxyborohydride (2.71 g, 12.8 mmol) was added in several portions over 10 min while the reaction was cooled in a  $10\text{ }^{\circ}\text{C}$  water bath. After stirring 45 min at room temperature the solvent was removed *in vacuo* and the residue was taken up in brine (10 ml) and 1N sodium hydroxide was added until solids disappeared. The reaction was extracted with ethyl acetate (4x 10 ml), the organic layer was dried with magnesium sulfate and evaporated to give (1*S*,2*S*)-*trans*-1-(*N,N*-dimethylaminomethyl)-2-[5-cyano-1-(*p*-toluenesulfonyl)indol-3-yl]-cyclopropane as a yellow oil.

The crude (1*S*,2*S*)-*trans*-1-(*N,N*-dimethylaminomethyl)-2-[5-cyano-1-(*p*-toluenesulfonyl)indol-3-yl]-cyclopropane was dissolved in ethanol (25 ml) and water (4 ml) with 10 N sodium hydroxide (2 ml, 20 mmol) and was heated at  $70\text{ }^{\circ}\text{C}$  for 1 hr. The reaction was cooled to room temperature, poured into brine (100 ml) and extracted with ethyl acetate (2x 50 ml) and 9:1 ethyl acetate / methanol (3x 50 ml). The organic layer was dried with magnesium sulfate and evaporated. The residue was purified by chromatography on silica with 90:10:1 chloroform / methanol / 2M ammonia in methanol to provide the product (1*S*,2*S*)-*trans*-2-[5-cyanoindol-3-yl]-1-(*N,N*-dimethylaminomethyl)cyclopropane as a yellow oil. A mixture of bromoethylamine hydrobromide (5.0 g, 24.4 mmol), isopropyl chloroformate (1.0 M in tetrahydrofuran, 16.3 ml, 16.3 mmol), and anhydrous dichloromethane (100 ml) was treated with triethylamine (4.5 ml, 33 mmol) and stirred at ambient temperature for 18 hr. The mixture was diluted with dichloromethane (200 ml), washed with 1 M hydrochloric acid, 1 M sodium hydroxide, and brine, dried over sodium sulfate and evaporated to give (2-bromo-ethyl)-carbamic acid isopropyl ester clear oil. <sup>1</sup>H-NMR δ (CDCl<sub>3</sub>) 5.01 (1 H, br s), 4.92 (m, 1 H), 3.58 (m, 2 H), 3.48 (m, 2 H), 1.25 (m, 6 H).

To a 1-dram vial were added (2-bromo-ethyl)-carbamic acid isopropyl ester (30 mg, 0.143 mmol), *trans*-2-[5-cyano-1-(*p*-toluenesulfonyl)indol-3-yl]-1-[N-methylaminomethyl]-cyclopropane (0.13 M in methanol, 1.0 ml, 0.13 mmol), and triethylamine (0.10 ml, 0.72 mmol). The vial was sealed with a Teflon cap and heated to 60°C on a shaken heating block for 18 hr. Sodium hydroxide (1 M, 1 ml) was added and heating at 60°C continued for 1 hr. The solvent was evaporated and the residue partitioned between 1 M sodium hydroxide and ethyl acetate. The aqueous phase was extracted with ethyl acetate and the pooled extracts dried over sodium sulfate and concentrated to an oily solid. Purification by preparative reverse phase high-performance liquid chromatography afforded the product as an oily trifluoroacetic acid salt. LC-MS: 1.15 min; 355.28 (MH)<sup>+</sup>.

A solution of bis(2,2,2-trifluoroethyl)(methoxycarbonylmethyl)phosphonate (470  $\mu$ L, 2.2 mmol) in anhydrous tetrahydrofuran (5 ml) was added to a stirred suspension of oil free sodium hydride (89 mg, 2.2 mmol) in anhydrous tetrahydrofuran (25 ml) maintained at 0 °C. The reaction was warmed to room temperature and was stirred for 1.5 h. After cooling to 0°C, [5-cyano-1-(*p*-toluenesulfonyl)indol-3-yl]carboxaldehyde (600 mg, 1.85 mmol) was added. The resulting mixture was stirred at room temperature for 5 hr. The solvent was evaporated and the residue taken up in brine (20 ml) and extracted with ethyl acetate

(3x 10 ml). The organic layers were dried with anhydrous magnesium sulfate and the solvent removed *in vacuo*. The product was purified by silica gel column chromatography with 15% ethyl acetate in hexanes to give 192 mg (27 % yield) of methyl (Z)-3-[5-Cyano-1-(p-toluenesulfonyl)indol-3-yl]-acrylate: <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>): δ 9.08 (1 H, s), 8.10 (1 H, d, J = 8.3 Hz), 7.92 (1 H, d, J = 1.0 Hz), 7.86 (2 H, d, J = 8.4 Hz), 7.59 (1 H, dd, J = 8.6, 1.5 Hz), 7.29 (2 H, d, J = 8.1 Hz), 6.98 (1 H, d, J = 13.0 Hz), 6.08 (1 H, d, J = 12.6 Hz), 3.80 (3 H, s), 2.37 (3 H, s); MS m/e 395.1 (M + H)<sup>+</sup>.

The following procedure was carried out behind a safety shield using plastic coated glassware free of scratches and ground glass joints. 1-Methyl-3-nitro-1-nitrosoguanidine (850 mg, 5.8 mmol) was carefully added portionwise over 10 min to a Erlenmeyer flask containing a swirled mixture of aqueous sodium hydroxide (100 ml, 5 N) and diethyl ether (50 ml) at 0°C. After vigorous bubbling had ceased, the organic layer (containing diazomethane) was decanted into a chilled (0°C) Erlenmeyer flask containing potassium hydroxide chips (2 g). The mixture was swirled for 10 min and the yellow solution was decanted into a dropping funnel. The solution of diazomethane was added over 10 min to an open flask containing a stirred mixture of methyl (Z)-3-[5-Cyano-1-(p-toluenesulfonyl)indol-3-yl]-acrylate (220 mg, 0.58 mmol) and palladium acetate (7 mg, 0.029 mmol) in dichloromethane (50 ml) maintained at 0 °C. After stirring for 30 min, the reaction was quenched with glacial acetic acid (2 ml) and poured into aqueous sodium hydroxide (0.5 N, 40 ml). The aqueous layer was extracted with ethyl acetate (3 x 10 ml). The organic layers were dried over anhydrous magnesium sulfate, and concentrated *in vacuo*. The product was purified by silica gel column chromatography with 15% ethyl acetate in hexanes to afford 187 mg (82% yield) of methyl [cis-2-[5-Cyano-1-(p-toluenesulfonyl)indol-3-yl]cycloprop-1-yl]-acrylate: <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>): δ 7.98 (1 H, d, J = 8.7 Hz), 7.89 (1 H, s), 7.73 (2 H, d, J = 6.7 Hz), 7.52 (2 H, m), 7.24 (2 H, d, J = 8.0 Hz), 3.34 (3 H, s), 2.38 (1 H, m), 2.34 (3 H, s), 2.22 (1 H, m), 1.61 (1 H, m), 1.25 (1 H, m); MS m/e 473.2 (M + H)<sup>+</sup>.

Powdered lithium aluminum hydride (120 mg, 3.16 mmol) was carefully added to a stirred solution of methyl [cis-2-[5-Cyano-1-(p-toluenesulfonyl)indol-3-yl]cycloprop-1-yl]-acrylate (185 mg, 0.47 mmol) in anhydrous tetrahydrofuran (10 ml) at -30 °C. The resulting mixture was stirred at -20 °C for 1.5 h. The reaction

was quenched with ethyl acetate (5 ml) and allowed to warm to room temperature. After 10 min, water (120  $\mu$ L) was added and after 5 min followed by a solution of aqueous sodium hydroxide (1N, 360  $\mu$ L). After a further 5 min water (120 ml) was added and the solution was stirred 20 min. The aluminum salts were removed by vacuum filtration. The salts were rinsed with ethyl acetate (100 ml) and the combined filtrates were concentrated in vacuo. The crude material was purified by silica gel column chromatography with 45% ethyl acetate in hexanes to afford 131 mg (76% yield) of *cis*-2-[5-Cyano-1-(*p*-toluenesulfonyl)indol-3-yl]cyclopropanemethanol as a white solid:  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ):  $\delta$  8.04 (1 H, d,  $J$  = 8.6 Hz), 7.99 (1 H, d,  $J$  = 1.0 Hz), 7.74 (2 H, d,  $J$  = 6.8 Hz), 7.57 (1 H, dd,  $J$  = 8.6, 1.6 Hz), 7.44 (1 H, d,  $J$  = 1.3 Hz), 7.26 (2 H, d,  $J$  = 8.2 Hz), 3.50 (1 H, m), 3.16 (1 H, m), 2.36 (3 H, s), 2.05 (1 H, m), 1.60 (1 H, m), 1.19 (1 H, m), 0.99 (1 H, t,  $J$  = 5.5 Hz), 0.72 (1 H, q,  $J$  = 5.6 Hz); MS  $m/e$  349 ( $\text{M-OH}$ ) $^-$ .

To a  $-78^\circ\text{C}$  solution of oxalyl chloride (52  $\mu$ L, 0.60 mmol) in anhydrous dichloromethane (20 ml) was added dimethylsulfoxide (50  $\mu$ L, 0.70 mmol) dropwise. After stirring 10 min, a solution of *cis*-2-[5-Cyano-1-(*p*-toluenesulfonyl)indol-3-yl]cyclopropanemethanol (129 mg, 0.35 mmol) in dichloromethane (5 ml) was added dropwise. After stirring 20 min at  $-78^\circ\text{C}$ , triethylamine (294  $\mu$ L, 2.10 mmol) was added dropwise. The reaction was stirred for 5 min at  $-78^\circ\text{C}$  and then allowed to warm to room temperature. The reaction was washed with water (2x 5 ml), dried with anhydrous magnesium sulfate and the solvent was evaporated to give the crude *cis*-2-[5-Cyano-1-(*p*-toluenesulfonyl)indol-3-yl]cyclopropanecarboxaldehyde.

A mixture of the crude *cis*-2-[5-Cyano-1-(*p*-toluenesulfonyl)indol-3-yl]cyclopropanecarboxaldehyde, dimethylamine (0.35 ml, 0.7 mmol, 2.0 M/THF), and anhydrous ethanol (10 ml) was heated with stirring until all solids were dissolved. The reaction vessel was removed from the heating source and sodium triacetoxyborohydride (300 mg, 1.41 mmol) was added. After stirring for 1 h, the solvent was evaporated. The residue was taken up in brine (10 ml) and aqueous 1N sodium hydroxide was added until solids disappeared. The aqueous layer was extracted with ethyl acetate (4x 10 ml), dried over anhydrous magnesium sulfate, and concentrated in vacuo to give the crude *cis*-2-[5-cyano-1-(*p*-toluenesulfonyl)indol-3-yl]-1-(*N,N*-dimethylaminomethyl)cyclopropane.

Water (4 ml) and an aqueous solution of sodium hydroxide (2 ml, 10 N) were sequentially added to a flask charged with a solution of crude *cis*-2-[5-cyano-1-(*p*-toluenesulfonyl)indol-3-yl]-1-(*N,N*-dimethylaminomethyl)cyclo-propane dissolved in anhydrous ethanol (15 ml). The resulting mixture was heated at 70 °C for 1 h. The solvent was evaporated and the residue was taken up in brine (10 ml). The aqueous layer was extracted with 10% methanol/ethyl acetate (3x 5 ml). The combined organic layers were dried over anhydrous magnesium sulfate and concentrated *in vacuo*. The crude material was purified by silica gel column chromatography and eluted using a step gradient of a solvent mixture [chloroform/ (2 M ammonia/methanol), 90/10, 80/20]. A solution of methylmagnesium bromide (3.0 M in diethyl ether, 0.826 ml, 2.48 mmol, 1.05 equiv) was added to a suspension of [*trans*-2-[5-cyano-1-(*p*-toluenesulfonyl)indol-3-yl]cycloprop-1-yl]-*N*-methoxy-*N*-methylcarboxamide (1 g, 2.36 mmol) in anhydrous diethyl ether (25 ml). The resulting mixture was stirred at 0 °C for 2 h. The reaction mixture was diluted anhydrous THF (15 ml) and stirred for an additional 3 h at 0 °C. The cold mixture was quenched with aqueous 1 M

hydrochloric acid (200 ml) and extracted with ethyl acetate (3 x 100 ml). The combined organic extracts were washed with brine (50 ml), dried over anhydrous magnesium sulfate, filtered, and concentrated. The crude reaction mixture was purified by silica gel column chromatography using a step gradient [2:1, 1:1 (hexanes/ethyl acetate)] to afford 0.518 g (58% yield) of *trans*-3-(2-acetyl-cyclopropyl)-1-(toluene-4-sulfonyl)-1H-indole-5-carbonitrile as a white solid: LC-MS (column = Phenomenex Luna C18 S10, 3 x 50 mm, start %B = 0, final %B = 100, gradient time = 2 min, flow rate = 5 ml/min) m/e 379 (M + H)<sup>+</sup>, *t*<sub>R</sub> 2.45 min.

Sodium cyanoborohydride (51 mg, 0.792 mmol, 3 equiv) was added to a stirred mixture of *trans*-3-(2-acetyl-cyclopropyl)-1-(toluene-4-sulfonyl)-1H-indole-5-carbonitrile (100 mg, 0.264 mmol), dimethylamine (2.0 M in THF, 2.64 ml, 5.28 mmol, 20 equiv), acetic acid (302  $\mu$ L, 5.28 mmol, 20 equiv) and powdered 4 A molecular sieves (150 mg, activated) in 2-propanol (2.0 ml). The resulting mixture was stirred at 50 °C for 20 h. Ethanol (5 ml), water (0.5 ml), and a solution of sodium hydroxide (10 M in water, 0.6 ml) were added to the reaction. The mixture was heated with stirring at 50 °C for 1 h. The reaction contents were poured into an aqueous solution of sodium hydroxide (1 M, 25 ml) and brine (25 ml). The aqueous layer was extracted with ethyl acetate (3 x 100 ml). The combined organic extracts were washed with brine (20 ml), dried over anhydrous magnesium sulfate, filtered, and concentrated in vacuo. The crude product was purified using silica gel column chromatography (90:10:1, CHCl<sub>3</sub>/MeOH/Et<sub>3</sub>N) to provide 67 mg (100% yield) of 3-[2-(1-dimethylamino-ethyl)-cyclopropyl]-1H-indole-5-carbonitrile as a 1:1 mixture of diastereomers. viscous oil: LC-MS (column = Phenomenex Luna C18 S10, 3 x 50 mm, start %B = 0, final %B = 100, gradient time = 3 min, flow rate = 4 ml/min) m/e 254 (M + H)<sup>+</sup>, *t*<sub>R</sub> 1.19 min.

### Preparative chiral HPLC resolution of racemic indole-cyclopropanes

The racemates were separated into their corresponding enantiomers on a 50 x 500 mm Chiralpak AD column using an eluent mixture of ethanol and hexane containing diethylamine modifier. With a flow rate of 60 ml/min, separation times were between 65 and 75 min. Injection loads were determined by the combination of compound solubility in 50:50 ethanol/hexane (more hexane if possible), and by the length of baseline separation time between each pair of enantiomers. Maximum loading for a single run with baseline separation was approximately 100-250 mg. The following preparative and analytical HPLC data exemplify these methods:

5 Butyllithium (2.5 M solution in hexanes, 10 ml, 25 mmol, 1.25 equiv) was added over 5 min to a suspension of the methyltriphenylphosphonium bromide (10.7 g, 30 mmol, 1.5 equiv) in anhydrous tetrahydrofuran (250 ml) maintained at 0 °C under an atmosphere of dry nitrogen. After complete addition, the reaction mixture was allowed to warm to room temperature and stir for 1 h. The resulting orange

Solid (5-cyanoindol-3-yl)carbox-aldehyde was added and the reaction mixture was allowed to warm to -5 °C over a period of 1 h. The reaction was quenched with water (250 ml) and extracted with ethyl acetate (3 x 100 ml). The organic extract was washed with brine (50 ml), dried over anhydrous magnesium  
15 sulfate, filtered, and concentrated in vacuo. The crude product was purified using silica gel column chromatography (step gradient: 5:1, 4:1 hexane/ethyl acetate) to afford 4.56 g (71% yield) of 1-(*p*-toluenesulfonyl)-3-vinylindole-5-carbonitrile as a white solid. ### **Serotonin Transporter Binding Assay**

HEK-293 cells that stably express human serotonin transporters (HEK-hSERT cells) were grown at 37 °C in 5% CO<sub>2</sub> as a monolayer in medium consisting of EMEM supplemented with 10% fetal bovine serum and G418 sulfate (500 µg/ml).

To prepare membranes for radioligand binding experiments, cells were rinsed twice

30

with phosphate-buffered saline (138 mM NaCl, 4.1 mM KCl, 5.1 mM Na<sub>2</sub>PO<sub>4</sub>, 1.5 mM KH<sub>2</sub>O<sub>4</sub>, 11.1 mM glucose, pH 7.4). Cells were transferred from plates to polypropylene tubes (16 x 100 mm), centrifuged at 1,200 x g for 5 min and were frozen at -80 °C until assay. Following centrifugation, pellets were resuspended by

5 homogenization in buffer consisting of 50 mM Tris (pH 7.7 at 25 °C), 120 mM NaCl and 5 mM KCl and then centrifuged at 32,000 x g for 10 min. Following centrifugation, supernatants were discarded and pellets were resuspended in buffer consisting of 50 mM Tris (pH 7.4 at 25 °C), 150 mM NaCl and 5 mM KCl. Membrane homogenates (200 µl/plate) were incubated with 1 nM [<sup>3</sup>H]-citalopram

10 (specific activity = 85 Ci/mmol) and increasing concentrations of test compounds for 1 hr at 25 °C in a total volume of 250 µl. The assay buffer consisted of 50 mM Tris (pH 7.4 at 25 °C), 120 mM NaCl and 5 mM KCl (pH 7.4 with conc. HCl). Plates were incubated for 1 hr at 25 °C, then filtered through 0.5% PEI treated Whatman GF/B filters using a Brandel cell harvester. Filters were washed three times with 3

15 ml of ice-cold tris wash buffer. Non-specific binding was defined with 10 µM fluoxetine. Amount of radioligand bound in the presence and absence of competitor was analyzed by plotting (-)log drug concentration versus the amount of radioligand specifically bound. The midpoint of the displacement curve (IC<sub>50</sub>, nM), signifies the potency. K<sub>i</sub> values were calculated using the method of Cheng and Prusoff (1973).

### Dopamine Binding Assay

HEK-293 cells that stably express recombinant human dopamine D<sub>2L</sub> receptors (HEK-D<sub>2L</sub> cells) were grown at 37°C in 5% CO<sub>2</sub> as a monolayer in medium consisting of EMEM supplemented with 10% fetal bovine serum and G418 sulfate

25 (500 µg/ml). To prepare membranes for radioligand binding experiments, cells were rinsed twice with phosphate-buffered saline (138 mM NaCl, 4.1 mM KCl, 5.1 mM Na<sub>2</sub>PO<sub>4</sub>, 1.5 mM KH<sub>2</sub>PO<sub>2</sub> 11.1 mM glucose, pH 7.4), and incubated for 5-10 min. at 4°C in hypotonic lysis buffer consisting of 10 mM Tris (pH 7.4) and 5 mM EDTA. Cells were transferred from plates to polypropylene tubes (16 x 100 mm),

30 homogenized and centrifuged at 32,000 x g for 20 min. Following centrifugation, pellets were resuspended by homogenization in buffer consisting of 50 mM Tris (pH 7.7 at 25°C) and 1 mM EDTA. Homogenates were stored at -80°C until needed. On the day of an experiment, homogenates were thawed then centrifuged at 32,000 x g

for 20 min. Following centrifugation, supernatants were discarded and pellets were resuspended in assay buffer consisting of 50 mM Tris (pH 7.4 at 25°C), 1 mM EDTA and 6 mM MgCl<sub>2</sub>. Membrane homogenates (~5 µg) were incubated with 150 pM [<sup>3</sup>H]-spiperone (Amersham Life Science) and increasing concentrations of test compounds for 1.5 hr at 22°C in a total volume of 400 µl. Reactions were stopped by addition of ice-cold assay buffer and filtration over glass fiber filters (Whatman GFB, pre-soaked in 0.05% polyethylenimine) using a microtitre format Brandel cell harvester. Filters were washed with 3 ml of ice-cold assay buffer. Non-specific binding was defined with 2 µM (+)butaclamol. K<sub>i</sub> values were calculated using the method of Cheng and Prusoff (1973). Protein concentrations were determined by the method of Bradford (1976) with BSA as a standard.

Compounds of the present invention demonstrating greater SERT binding than hD<sub>2L</sub> binding may be useful for the treatment of depression, anxiety disorders, premature ejaculation, chronic pain, obsessive-compulsive disorder, feeding disorders, premenstrual dysphoric disorder and panic disorders. Compounds of the present invention demonstrating greater hD<sub>2L</sub> binding than SERT binding may be useful for the treatment of various psychotic disorders including bipolar disorder and schizophrenia. Compounds which have a strong affinity to the hD<sub>2L</sub> receptor may exhibit dopamine receptor-related side effects such as rigidity, stiff posture and tics such as lip smacking, head turning and sudden arm movements.

In the table below, binding results are denoted as follows:

- A: K<sub>i</sub> < 1 nM;
- B: 1 nM < K<sub>i</sub> < 10 nM;
- 25 C: 10 nM < K<sub>i</sub> < 100 nM;
- D: 100 nM < K<sub>i</sub> < 1000 nM;
- E: K<sub>i</sub> ≥ 1000 nM.
